<b>14. ABSTRACT</b> A better understanding of the nature of chronic pain after combat related TBI is of central importance in the treatment of warfighters who suffer from this condition. The broad objective of this work is to characterize the neural networks involved in post-traumatic pain using functional MRI both in the resting state and during activation with a moderately painful stimulus. The hypothesis is that the patterns of activation under both conditions are abnormal and similar to those in other chronic pain states such as migraine and fibromyalgia when controlled for co-morbid insomnia, depression and PTSD. The study groups to be compared for this work include patients with chronic migraine, fibromyalgia, post-traumatic pain post mTBI, asymptomatic individuals post mTBI, and normal controls. Resting state network characteristics will be determined by MRI at rest and contrasted to the pattern of activation during a visual attention task. Next, a calibrated degree of moderate pressure will be applied to the left thumb. Resting state fMRI data will be

INTRODUCTION: The study was a prospective study designed to characterize pain pathway activation in the brains of mild traumatic brain injury patients with chronic pain, and to compare with other demographically-matched individuals with and without chronic pain disorders. The specific study groups to be compared for this work included patients with chronic migraine, fibromyalgia, post-traumatic pain post mTBI, asymptomatic individuals post mTBI, and normal controls. The understanding of the neurobiology of chronic pain and mTBI used magnetic resonance imaging (MRI) methods to quantify the structural changes and functional activation patterns at rest and during *task* performance associated with chronic pain in TBI. A major emphasis of our study was to understand the connectivity of regions associated with chronic pain.

Structural imaging metrics involve high resolution MRI for grey matter analyses and DTI to assess white matter connectivity. Resting state fMRI is used to develop a neural network model of functional connectivity within regions of interest (those known to be part of the classic pain matrix and the so called “default” mode, a network that regulated higher cortical processing). The broad objective of this work was to gain a better understanding of the pattern of resting state connectivity in chronic pain and use these data to differentiate chronic pain in TBI from normal and other pain states. The goal was to use task fMRI to assess the regions activated during pain stimulation in each subject group and to then conduct effective connectivity analysis that will allow us to probe which connections are modulating others in the pain pathway of individuals who suffer from chronic headache and somatic pain after mTBI using non-invasive brain imaging methods. Imaging data was to be correlated with behavioral data and be used to understand the neural networks involved in chronic pain in the experimental group when controlling for comorbid PTSD, life stress, depression and insomnia. The intent was to more fully characterize the nature of pain pathway abnormalities and use this information to develop measures that assist in differential diagnosis of pain syndromes and to provide a metric of treatment responsiveness to predict treatment outcomes.

BODY:

The approved statement of work outlined the tasks to be completed:

Task 1 (months 1-6): Characterize resting state and mild pain stimulated neural networks in previously identified individuals with chronic pain. Two subtasks were identified, that included:

- 1) Enrollment of 150 participants from five experimental groups: chronic pain following mild traumatic brain injury (mTBI), those with fibromyalgia, chronic migraine without aura, asymptomatic individuals after mTBI, and in normal controls, and
- 2) MRI scanning and completion of the behavioral measures on all enrolled participants

Task 2 (months 18-21): Data analysis to include DTI, resting state network and fMRI analysis, and functional/structural imaging correlation.

Task 3 (months 21-24): Generate final report and publish results.

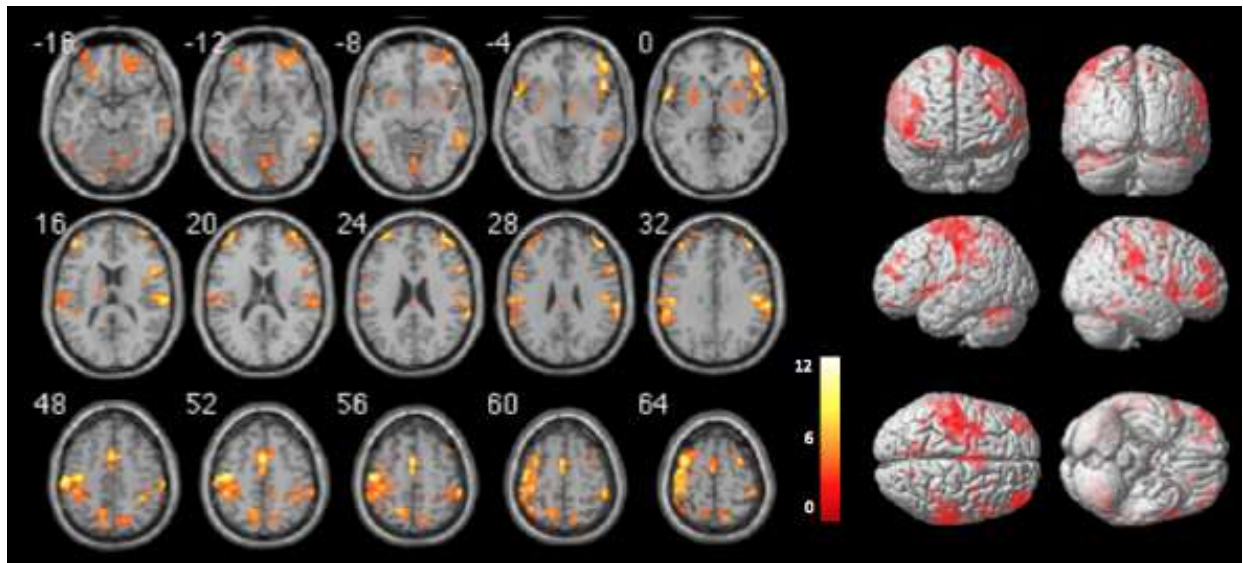

To complete subtasks two and three, following approvals and MRI sequence refinement, a phased recruitment strategy was implemented in September 2011.

To date, six control participants, seven fibromyalgia patients, three migraine with aura, and two mild TBI patients with chronic pain completed the study in its entirety. One control patient scan was incomplete due to an expected power failure during scanning, and another control patient withdrew from the study after consenting. One control subject was not able to be scheduled for imaging due to work conflicts.

**Figure 2.** MRI scanner used for this study

Preliminary fMRI results from normal controls and from fibromyalgia subjects showed consistent to good activations in response to the moderately painful stimulus in all of the regions of the pain network (i.e. primary and secondary somatosensory regions, insula, cingulate, primary motor regions, thalamus and cerebellum). In the same subjects, fMRI during mental tasking has also shown consistent activation. Further post-imaging analysis of the remaining fMRI subjects and DTI and resting state data for all subjects were not completed.

**Figure 3.** BOLD response for a single subject (migraine with aura patient). Activations shown are a result of the pain condition versus rest contrast and identify regions of the pain network. Transverse slices are shown on the left and a 3D rendered image is shown on the right.

Recruitment proved to be the major obstacle in the study. First, the overall population of mTBI patients available to be enrolled in the clinic remains low; most were still recruited primarily into the SCORE! (Study of Cognitive Rehabilitation Effectiveness for mild traumatic brain injury) and its associated MRI intensive counterpart iSCORE study at the San Antonio Military Medical Center (SAMMC) through the TBI Service and the DVBIC Service (Defense Veterans Brain Injury Consortium), providing a significantly reduced pool of available subjects.

The logistics of scanning subjects at a separate nonmilitary institution was daunting to some subjects. Third, there were constant personnel changes at UTHSCSA (University of Texas Health Science Center at San Antonio) to facilitate operations between SAMMC and the Research Imaging Center at UTHSCSA. In projecting for another no-cost extension beyond January 2014, there would not be enough TBI subjects to be recruited to be able to power the study sufficiently to compare to normal and fibromyalgia subjects.

#### KEY RESEARCH ACCOMPLISHMENTS:

- Successful development of an experimental paradigm to support this study, and future studies of chronic pain in active duty servicemembers, veterans, and civilians.

- Analysis strategy were fully developed and initial imaging data was excellent (e.g., Figure above fMRI results).

#### REPORTABLE OUTCOMES:

Interpretation of the raw imaging data showed resting state and pain activation data was best achieved as expected in subjects with chronic pain conditions. Activation in subjects with fibromyalgia was the most robust, followed by the subjects with chronic pain in TBI. Normal control subjects and those with migraine headaches had less robust activation patterns overall; the small study size limits the results to a general impression only and is not powered to a degree to make any definitive conclusions.

Raw data from subject pain and coping questionnaires is attached. The subject number is too low to make any generalized conclusions. It is worth noting subjects were able to answer these questionnaires quickly (average time to completion was 30 minutes) despite the large number of forms. A concern expressed by the Air Force JAG/Wilford Hall IRB regarding the safety and possible self-incrimination the surveys posed was not expressed by any subject.

Robin, DA Using brain imaging to understand chronic pain and fatigue. Presented to Neuroscience Grand Rounds, UTHSCSA, September 2011.

#### CONCLUSION:

Despite a good hypothesis and sound initial proof of concept, slow subject recruitment limited adequate data acquisition to complete the study. There is continued acknowledgement of chronic pain following mTBI and deployment in active duty service

members and veterans [2]. This study, despite its limitations, remains could be continued, perhaps at another venue in the future to contribute to an understanding of the changes in the brain that perpetuate pain in this population and other chronic pain conditions. In addition, the study still offers a platform for which to build clinical trials with an objective endpoint measure (fMRI activation to a painful stimulus), relevant to postconcussive symptoms.

MASQ	QUESTION GROUP: MASQ	1= Not at all; 5= Extremely
MASQ01	Felt cheerful	1-5
MASQ02	Felt afraid	1-5
MASQ03	Startled easy	1-5
MASQ04	Felt confused	1-5
MASQ05	Slept very well	1-5
MASQ06	Felt sad	1-5
MASQ07	Felt very alert	1-5
MASQ08	Felt discouraged	1-5
MASQ09	Felt nauseous	1-5
MASQ10	Felt like crying	1-5
MASQ11	Felt successful	1-5
MASQ12	Had diarrhea	1-5
MASQ13	Felt worthless	1-5
MASQ14	Felt really happy	1-5
MASQ15	Felt nervous	1-5
MASQ16	Felt depressed	1-5
MASQ17	Felt irritable	1-5
MASQ18	Felt optimistic	1-5
MASQ19	Felt faint	1-5
MASQ20	Felt uneasy	1-5
MASQ21	Felt really bored	1-5
MASQ22	Felt hopeless	1-5
MASQ23	Felt like I was having a lot of fun	1-5
MASQ24	Blamed myself for a lot of things	1-5
MASQ25	Felt numbness or tingling in my body	1-5
MASQ26	Felt withdrawn from other people	1-5
MASQ27	Seemed to move quickly and easily	1-5
MASQ28	Was afraid I was going to lose control	1-5
MASQ29	Felt dissatisfied with everything	1-5
MASQ30	Looked forward to things with enjoyment	1-5
MASQ31	Had trouble remembering things	1-5
MASQ32	Felt like I didn't need much sleep	1-5
MASQ33	Felt like nothing was very enjoyable	1-5
MASQ34	Felt like something awful was going to happen	1-5
MASQ35	Felt like I had accomplished a lot	1-5
MASQ36	Felt like I had a lot of interesting things to do	1-5
MASQ37	Did not have much of an appetite	1-5

MASQ38	Felt like being with other people	1-5
MASQ39	Felt like it took extra effort to get started	1-5
MASQ40	Felt like I had a lot to look forward to	1-5
MASQ41	Thoughts and ideas came to me very easily	1-5
MASQ42	Felt pessimistic about the future	1-5
MASQ43	Felt like I could do everything I needed to do	1-5
MASQ44	Felt like there wasn't anything interesting or fun to do	1-5
MASQ45	Had pain in my chest	1-5
MASQ46	Felt really talkative	1-5
MASQ47	Felt like a failure	1-5
MASQ48	Had hot or cold spells	1-5
MASQ49	Was proud of myself	1-5
MASQ50	Felt very restless	1-5
MASQ51	Had trouble falling asleep	1-5
MASQ52	Felt dizzy or lightheaded	1-5
MASQ53	Felt unattractive	1-5
MASQ54	Felt very clearheaded	1-5
MASQ55	Was short of breath	1-5
MASQ56	Felt sluggish or tired	1-5
MASQ57	Hands were shaky	1-5
MASQ58	Felt really "up" or lively	1-5
MASQ59	Was unable to relax	1-5
MASQ60	Felt like being by myself	1-5
MASQ61	Felt like I was choking	1-5
MASQ62	Was unable to laugh easily	1-5
MASQ63	Had an upset stomach	1-5
MASQ64	Felt inferior to others	1-5
MASQ65	Had a lump in my throat	1-5
MASQ66	Felt really slowed down	1-5
MASQ67	Had a very dry mouth	1-5
MASQ68	Felt confident about myself	1-5
MASQ69	Muscles twitched or trembled	1-5
MASQ70	Had trouble making decisions	1-5
MASQ71	Felt like I was going crazy	1-5
MASQ72	Felt like I had a lot of energy	1-5
MASQ73	Was afraid I was going to die	1-5
MASQ74	Was disappointed in myself	1-5

MASQ75	Heart was racing or pounding	1-5
MASQ76	Had trouble concentrating	1-5
MASQ77	Felt tense or "high strung"	1-5
MASQ78	Felt hopeful about the future	1-5
MASQ79	Was trembling or shaking	1-5
MASQ80	Had trouble paying attention	1-5
MASQ81	Muscles were tense or sore	1-5
MASQ82	Felt keyed up, "on edge"	1-5
MASQ83	Had trouble staying asleep	1-5
MASQ84	Worried a lot about things	1-5
MASQ85	Had to urinate frequently	1-5
MASQ86	Felt really good about myself	1-5
MASQ87	Had trouble swallowing	1-5
MASQ88	Hands were cold or sweaty	1-5
MASQ89	Thought about death or suicide	1-5
MASQ90	Got tired or fatigued easily	1-5
